

OrientDB Package

The function **ODBapi** in this package is built on top of the **URLFetch** built-in function. OrientDB RESTful HTTP API commands are ported into Wolfram Language through **URLFetch** and then **ODBapi** commands are built with arguments that specify options with rules of the form name→value. This package has also other utility functions especially implemented for OrientDB.

- **OrientDB API**

ODBapi — The main function of the package

- **Utility Functions**

ODBgetDataset — Transforms OrientDB JSON response to a **Dataset**

ODBgetFieldAttributes — Returns field attributes of OrientDB class represented with a **Dataset**
